DERMASAVER CASE STUDY

CASE STUDY

WRENTHAM DEVELOPMENTAL CENTER, WRENTHAM, MA

■ BY MAUREEN ETHIER, RN, NURSING SUPERVISOR, UNIT 2

DERMASAVER ARM TUBES

BEFORE USING DERMASAVER ARM TUBES

2/15/08

AFTER 7 WEEKS USING DERMASAVER ARM TUBES

4/8/08

The resident is a 52 year old female with the diagnosis of Mental Retardation, Seizure Disorder, Cerebral Palsy and Osteoporosis, who sustained a friction injury to her right wrist resulting in cellulitis. She also has degenerative disease causing cervical stenosis with atrophy and loss of function in both forearms.

On 2/15/08 DermaSaver Arm Tubes were issued in conjunction with a topical treatment. Within a short time improvement was noted and the wound healed. Resident now enjoys wearing DermaSaver tubes on both arms daily. The products are comfortable and washable, which makes them very appropriate for our population.

We were extremely pleased with the results of this study and plan to continue to use DermaSaver products on a regular basis in our facility.
